

ABSTRACT OF THE DISCLOSURE

Each of a set of cards for a game has a resistance member printed thereon by applying resist ink thereto so that the character of each card can be specified by reading the resistance value of the resistance member. Further, when the parameter of the character is corrected based on the difference of the resistance value, the game can be provided with a contingent factor. With this arrangement, the character of the card can be read at less expensive cost as compared with a case in which it is read through a barcode displayed on a card because an expensive card reader having a complex structure is necessary to read the barcode.
